Dear Patient,

Now that your implant(s) is uncovered, the following information is very important for you to read and understand. If you have any questions, please call us and we will go over an explanation of this letter.

The liquid medication Preidex or PerioGard will be prescribed for you. Dip a cotton swab into the solution and vigorously swap around the implant(s) for one to three minutes. Please do not rinse with the medication for it has a tendency to stain teeth. Staining can be removed by professional cleaning. Only a cotton swab will be used for the first week. Once healed the #308 tuft-end brush, dipped in the above solutions, may be used around the implant(s).

Healing collars have a tendency to slightly loosen. If this occurs please call us immediately. The healing collar must be tightened as soon as possible to prevent it from coming out.

Stay on your regular cleaning schedule during the implant(s) process. It is important that you remind the hygienist that you have dental implant(s) uncovered. These implant(s) can not be cleaned with the normal metal instruments or by the ultrasonic "cavitron" instrument.

After the gums heal around the healing collar, Dr. Morton will advise you when to proceed with the restorative phase of treatment with your general dentist. Great communication between offices, doctors, and you make the successful results we all want.

Sincerely,

M. J. Morton, D.M.D.
